

ABG Walk-In: A Real-Time Walk-In Availability and Service Capacity System for ABG Studios

MAIN PROBLEM

Isa sa recurring questions ng ABG clients ay:

“Pwede po walk-in?”

The problem is, hindi agad makapagbigay ng accurate answer ang staff.

Currently, ganito ang process:

Client:

“Hi po, pwede po walk-in today?”

↓

ABG Staff:

“Wait lang po, ask ko muna sa GC.”

↓

Staff sends message sa GC:

“May available bang NT for walk-in?”

↓

Wait for response...

↓

Staff checks kung:

- May available na NT
- May ongoing appointments
- Puno na ba ang studio
- May available na service

Staff replies sa client.

✗ Problems with the current process:

- Delayed response to clients
- Staff needs to repeatedly ask the GC
- Availability information is scattered
- Different staff may have different information
- Client has to wait before deciding whether to visit
- Walk-in availability can change throughout the day

PROPOSED SOLUTION

ABG Walk-In

A web-based system that provides clients with current walk-in availability and service capacity while allowing ABG staff to update the studio's current operational status.

Instead of clients asking:

“Pwede po walk-in?”

and waiting for staff to check the GC, they can simply check:

“Is ABG currently accepting walk-ins?”

The system displays the latest availability based on the information updated by staff.

CLIENT SIDE

The client doesn't need an account or complicated process.

They simply open:

ABG Walk-In Availability

Then they see:

WALK-INS AVAILABLE

Current Studio Capacity

4 / 6 clients

Available Technicians

2

Estimated Waiting Time

15–30 minutes

Services Currently Available

Nails

Lashes

Foot Spa

Last updated: 5:42 PM

EXAMPLE WHEN UNAVAILABLE

WALK-INS CURRENTLY UNAVAILABLE

We're currently unable to accommodate walk-in clients.

Reason:

No available technicians at the moment.

or:

Studio is currently at full capacity.

This means the client doesn't need to send a message just to ask whether they can come.

LIMITED AVAILABILITY

Pwede rin magkaroon ng third status:

LIMITED AVAILABILITY

Walk-ins may be accommodated depending on service and technician availability.

Available Technicians: 1

Current Capacity: 5 / 6

This is useful because hindi naman always simply:

Available / Not Available.

Sometimes technically available, pero very limited.

STAFF SIDE

Ito yung important part.

The system doesn't magically know whether the shop is full or whether an NT is available.

Staff updates the current information.

1. Technician Availability

Staff dashboard:

Today's Technician Status

Technician	Status
NT 01	 Available

NT 02  With Client

NT 03 
Appointment

NT 04  Unavailable

Staff can update the status when needed.

Possible statuses:

-  Available
 -  Busy / With Client
 -  Reserved / Appointment
 -  Unavailable
-

2. Studio Capacity

Staff can update:

Current Studio Capacity

Current Clients: 4

Maximum Capacity: 6

So the system knows:

4/6 → still has capacity

6/6 → full

3. Service Availability

Staff can also indicate which services are currently available.

For example:

 Nails

 Available

 Lashes

 Available

 Foot Spa

 Unavailable

This matters because sometimes the studio itself isn't necessarily full, but a specific service can't currently accommodate another client.

HOW DOES THE SYSTEM DETERMINE THE STATUS?

This is where your system becomes more than just a static announcement page.

The staff provides the current data.

Then the system evaluates it.

Example:

Available NTs: 2

Capacity: 4/6

 **WALK-IN AVAILABLE**

Another example:

Available NTs: 1

Capacity: 5/6

 **LIMITED AVAILABILITY**

Another:

Available NTs: 0

Capacity: 4/6

 **WALK-IN UNAVAILABLE**

Because even though there is physical space, there is no technician available.

Another:

Available NTs: 2

Capacity: 6/6

 **WALK-IN UNAVAILABLE**

Because the studio is already full.

So the system considers both technician availability and studio capacity.

COMPLETE WORKFLOW

STAFF

Log in

Update technician availability

Update current studio capacity

Update service availability

SYSTEM

Processes current information

Determines walk-in status

CLIENT

Checks ABG Walk-In Availability

SYSTEM

Shows:

-  **Available**
-  **Limited**
-  **Unavailable**

Client decides whether to visit ABG

WHAT IS THE INNOVATION?

Don't just say:

"It shows availability."

That's too weak.

Your innovation is:

The system centralizes real-time technician and studio capacity information into a client-facing walk-in availability status, eliminating the need for clients to wait while staff manually checks availability through a group chat.

Current process:

Client asks

Staff asks GC

Wait

Staff receives response

Staff replies client

New process:

Staff updates availability

System determines status

Client checks status

Immediate information

DATABASE / FULL-STACK PART

Possible tables:

staff

Stores technician/staff information.

- ID
- Name
- Role
- Status

services

Stores ABG services.

- Service ID
- Service name
- Category
- Availability

studio_capacity

Stores:

- Current capacity
- Maximum capacity
- Date/time updated

walkin_status

Stores:

- Status
- Reason
- Timestamp

You don't necessarily need all of these as separate tables if your group wants to simplify the database.

CRUD OPERATIONS

Technician Management

Create

→ Add technician

Read

→ View technicians

Update

→ Change availability status

Delete

→ Remove inactive technician

Service Management

Create

→ Add service

Read

→ View services

Update

→ Change availability

Delete

→ Remove unavailable/discontinued service

This gives you natural CRUD without forcing unnecessary features.

TECHNICAL REQUIREMENTS

Vue.js

✓ Primary frontend

Tailwind CSS

✓ Responsive UI

Complete workflow

✓ Staff updates → system processes → client checks

Input validation

✓ Staff must provide valid status/capacity

✓ Capacity cannot exceed maximum

✓ Cannot use negative values

✓ Required fields validated

Persistent data

✓ Availability and capacity stored in database

CRUD

✓ Staff + services + availability data

Innovation

✓ Real-time client-facing walk-in availability

Feedback

Client:

- Walk-ins available
- Limited availability
- Currently unavailable

Staff:

- ✓ Availability updated successfully
- ⚠ Invalid capacity

Empty state:

No technicians available

PROJECT SCOPE

One Primary Problem

Clients cannot immediately know whether ABG Studios can accommodate walk-ins because staff currently needs to manually check technician and studio availability before responding.

Primary User

ABG Studios clients

Secondary User

ABG staff

Main Workflow

Staff updates availability → System determines status → Client checks walk-in availability

Three Core Features

① Real-Time Walk-In Status

Client can view current availability.

② Technician Availability Management

Staff updates who is available/busy/unavailable.

③ Studio & Service Capacity Management

Staff updates current capacity and service availability.
